 $[Ru(\eta^6-benzene)(\eta^5-cyclopentadienyl)]PF_6$

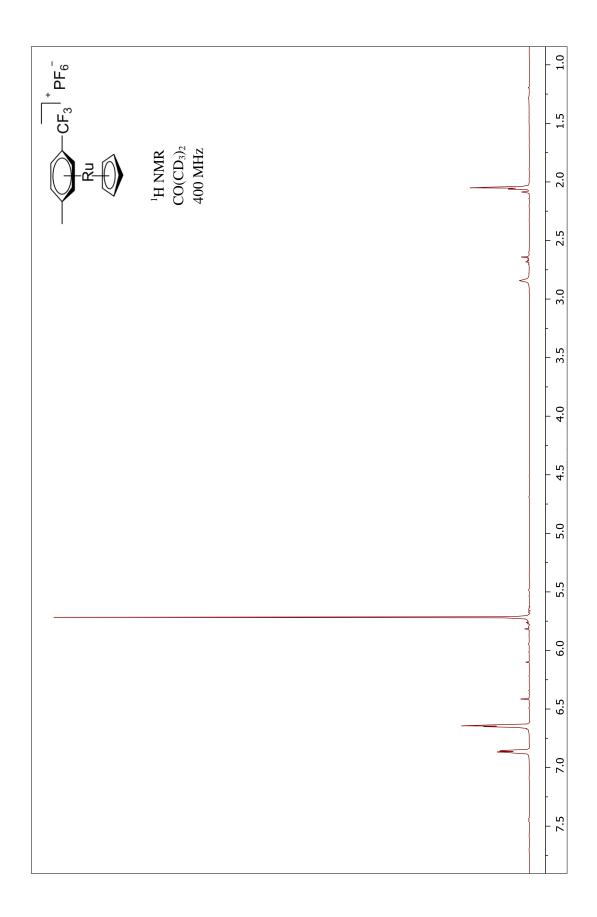

The reaction is a modification of the existing literature procedure. A 100 mL oven dried round-bottom flask equipped with a stir-bar was charged with finely ground potassium carbonate (0.83 g, 6.00 mmol, 6.0 equiv) and the flask flame-dried under vacuum. After cooling to room temperature, the flask was further charged with [(C₆H₆)RuCl₂]₂ (0.50 g, 1.00 mmol) and a reflux condenser added. Ethanol (30 mL) was then added, followed by freshly cracked cyclopentadiene (1.5 mL, 18.0 mmol, 18 equiv). The resulting heterogeneous brown mixture was then warmed to 85 °C with rapid stirring. After approximately 16 h, the reaction mixture was cooled to room temperature and filtered through a plug of Celite, and the Celite rinsed with a further 25 mL of ethanol. The dark yellow filtrate was concentrated to 20 mL, then an aqueous solution of NH₄PF₆ (0.68 g, 4.20 mmol, 4.2 equiv, in 10 mL of H₂O) was added, resulting in the immediate formation of a tan precipitate. The remaining ethanol was removed under reduced pressure and the resulting suspension cooled for several hours. The mixture was then filtered and the tan solid dried under vacuum. The crude product was subsequently dissolved in a minimum of acetonitrile and diethyl ether added dropwise until precipitate formation was no longer observed. This mixture was cooled for several hours before being filtered to give the title compound as a light brown solid 0.718 g (92%). The product is spectroscopically identical to the known $[(\eta^6-C_6H_6)Ru(C_5H_5)]PF_6^2$ and is pure by ¹H NMR spectroscopy to the limits of detection. $\delta_{\rm H}$ (acetone-D₆) 6.36 (6H, s, H¹), 5.56 (5H, s, H^2).

The resulting solution was heated to reflux for 16 hours under an inert atmosphere, allowed to cool to room temperature and filtered. The filtrate was concentrated in vacuo, redissolved in a minimum of MeCN and added dropwise to Et₂O. The brown precipitate was isolated by filtration, rinsed with ether, dissolved in MeCN, concentrated in vacuo and dried under vacuum to give the *title compound* as a brown solid (153 mg, 82%); $\delta_{\rm H}$ (acetone-D₆) 6.82 (2H, dd, ${}^3J_{\rm H-H}$ 6.0 Hz, ${}^3J_{\rm H-F}$ 4.5 Hz, H²), 6.47 (2H, td, ${}^3J_{\rm H-H}$ 6.0 Hz, ${}^4J_{\rm H-F}$ 4.0 Hz, H³), 6.27 (1H, td, ${}^3J_{\rm H-H}$ 6.0 Hz, ${}^5J_{\rm H-F}$ 3.5 Hz, H⁴) 5.65 (5H, s, H⁵); $\delta_{\rm C}$ (acetone-D₆) 136.9 (1C, d, ${}^1J_{\rm C-F}$ 276 Hz, C¹), 85.2 (1C, s, C⁴), 84.9 (2C, d, ${}^3J_{\rm C-F}$ 6 Hz, C³), 81.6 (5C, s, C⁵), 77.4 (2C, d, ${}^2J_{\rm C-F}$ 21 Hz, C²); $\delta_{\rm F}$ (acetone-D₆) -72.6 (6F, d, ${}^1J_{\rm F-P}$ 707 Hz, F^{counterion}), -137.5 (1F, m, F^{arene}); $\delta_{\rm P}$ (acetone-D₆) -144.3 (sept., $J_{\rm P-F}$ 707 Hz); m/z (HRMS⁺) 256.9836 [M-PF₆]⁺ (C₁₁H₁₀F⁹⁶Ru requires 256.9842). 1. Crystal and Structural Refinement Data for Complex 1

The X-ray single crystal data have been collected using $\lambda MoK\alpha$ radiation (λ =0.71073Å) on an Agilent XCalibur (Sapphire-3 CCD detector, fine-focus sealed tube, graphite monochromator) diffractometer equipped with a Cryostream (Oxford Cryosystems) open-flow nitrogen cryostat at the temperature 120.0(2)K. The structure was solved by direct method and refined by full-matrix least squares on F² for all data using Olex2 [3] and SHELXTL [4] software. All non-hydrogen atoms were refined anisotropically, hydrogen atoms were placed in the calculated positions and refined in riding mode. Crystal data and parameters of refinement are listed in Table S1. Crystallographic data for the structure have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication CCDC-1546706.
